

Okta SSO Setup Guide

Connect your company's Okta to Alenio so your team can sign in with work credentials.

For Alenio workspace owners and IT administrators

alenio.com

1. Overview

Alenio supports Single Sign-On (SSO) with Okta using OpenID Connect (OIDC). After setup, users with your company email domain can sign in at alenio.com using **Continue with company SSO**.

What this guide covers

- Creating an Okta OIDC application for Alenio
- Connecting Okta inside Alenio Settings
- Testing sign-in for your users

What this does not require

You do **not** need Alenio listed in the Okta Integration Network (OIN) catalog to use SSO.

Users are signed into Alenio when they authenticate with Okta. Automatic bulk provisioning from Okta (SCIM) is not part of this setup.

2. Before you begin

- An Alenio workspace where you are the **owner**
- Access to your company's **Okta Admin Console**
- Permission to create applications and assign users in Okta
- Your company email domain (example: **acme.com**)

3. Part A — Create the Alenio app in Okta

Complete these steps in **your company's Okta Admin Console** (not the Okta Integration Network).

Step 1. Go to **Applications** → **Applications**.

Step 2. Click **Create App Integration**.

Step 3. Select **OIDC – OpenID Connect**, then **Web Application**. Click **Next**.

Step 4. Set **App name** to **Alenio** (or your preferred name).

Step 5. Under Grant type, keep **Authorization Code** enabled.

Step 6. Add this exact value under **Sign-in redirect URIs**:

```
https://alenio-backend-production.up.railway.app/api/sso/callback/okta
```

Step 7. Optional: set **Sign-out redirect URI** to `https://alenio.com/login`.

Step 8. Leave **Trusted Origins** empty.

Step 9. Under Assignments, choose **Allow everyone in your organization to access** or limit to selected groups. Then click **Save**.

Step 10. On the app page, copy:

- **Client ID**
- **Client secret**
- **Okta domain / Issuer** (usually `https://your-company.okta.com`)

4. Part B — Connect Okta in Alenio

Step 1. Sign in to <https://alenio.com> as the **workspace owner**.

Step 2. Open **Settings**.

Step 3. Click **Set up Okta**.

Step 4. If prompted, click **Create organization** (links Okta to your workspace).

Step 5. Paste your Okta values:

- **Issuer URL** — e.g. <https://your-company.okta.com>
- **Client ID**
- **Client secret**
- **Company email domain** — e.g. [acme.com](#) (no @ symbol)

Step 6. Check:

- **Enable Okta SSO for this domain**
- **Mark domain verified** (required for login until DNS verification is available)

Step 7. Click **Save Okta settings**.

5. Part C — Test sign-in

Step 1. Sign out of Alenio, or open a private/incognito browser window.

Step 2. Go to <https://alenio.com/login>.

Step 3. Enter a user email on your company domain (example: [you@acme.com](#)).

Step 4. Click **Continue with company SSO** (password is not required for this path).

Step 5. Sign in at Okta when prompted.

Step 6. You should return to Alenio signed in.

After a successful first SSO sign-in, Alenio can create the user account automatically. If your organization has a default workspace configured, the user may also be added there.

6. Troubleshooting

Issue	What to check
"No company SSO is set up..."	Domain in Alenio must match the email domain. Enable SSO and mark the domain verified.
Okta redirect URI mismatch	Sign-in redirect URI in Okta must exactly match the callback URL shown in Alenio Okta settings.

Error after Okta login	Confirm Client ID, Client secret, and Issuer. Confirm the Okta user's email uses your company domain.
User can't access the app in Okta	In Okta, assign the Alenio app to that user or their group.

7. Need help?

If you get stuck, contact Alenio support at **info@alenio.com** and include:

- Your company domain
- A screenshot of the Okta redirect URI settings
- The exact error message from the Alenio login page
